

# A new satellite data product for studying fire combustion efficiency, fire emission speciation, and fire weather at night and beyond

**Jun Wang (PI)**, Meng Zhou, Lorena Castro Garcia (U. Iowa); Co-Is: Lu Hu, Bob Yokelson (U. Montana); Tara Yacovitch, Scott Herndon (Aerodyne Inc.); D. Peterson (NRL). Collaborator: Zhuosen Wang (UMCP).

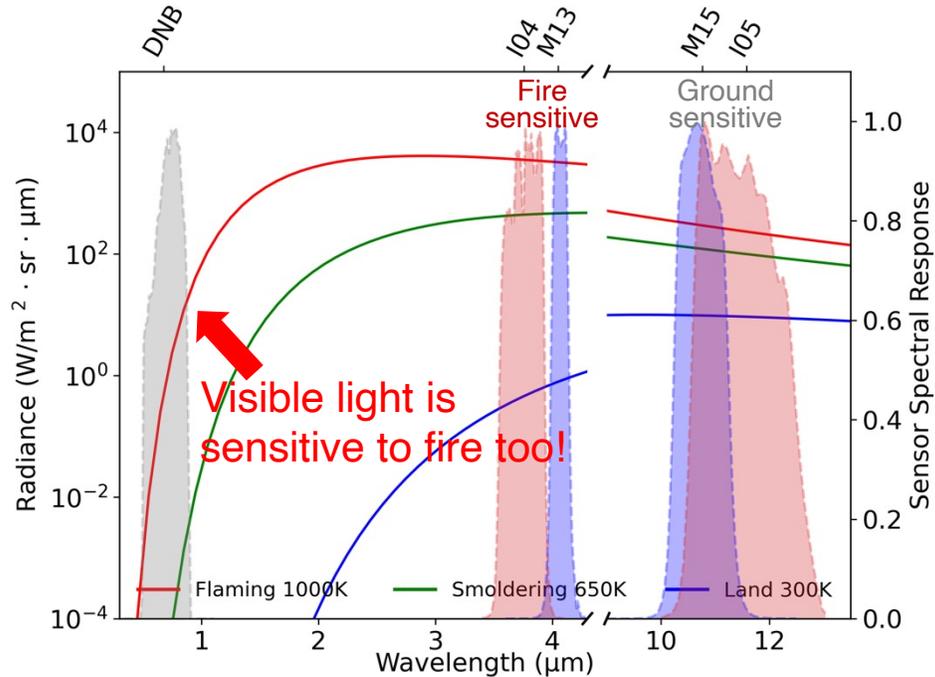

**Modified combustion efficiency**  $MCE = \frac{CO_2}{CO_2 + CO}$

# A new satellite data product for studying fire combustion efficiency, fire emission speciation, and fire weather at night and beyond

## Fire Light Detection Algorithm version 2 (FILDA-2)

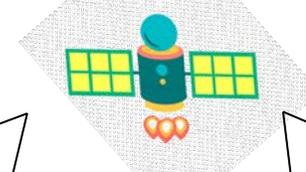

Newly defined parameter for combustion status characterization:

### Visible Energy Fraction (VEF)

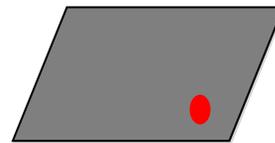

$$VEF = \frac{VLP}{FRP}$$

Visible light power - provided by Nighttime Visible observation

Fire radiative power - Total power retrieved from IR band.

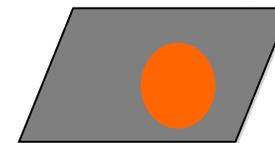

Satellite Pixel #1  
High fire temp. Small fire area

Flaming, more energy distributed in Visible, High VEF.

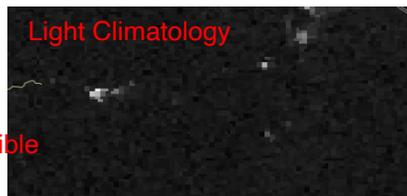

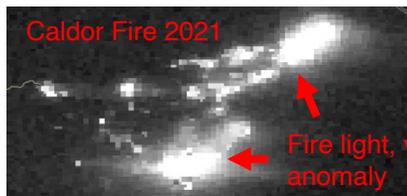

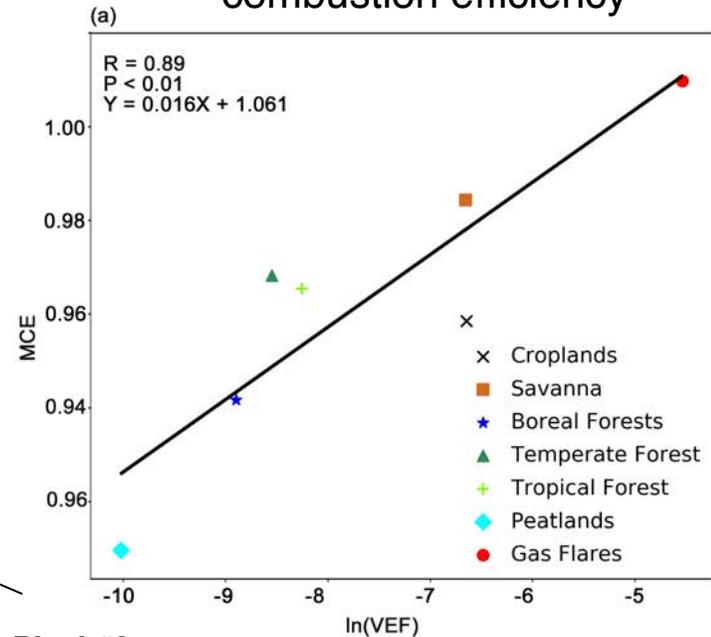

Satellite Pixel #2  
Cooler fire temp. Large fire area

Smoldering, less energy distributed in Visible, Low VEF.

Same FRF, but different VEF at the pixel level.

VEF is a robust indicator of combustion efficiency

- Visible light is an inherent character of wildfire
- Fire is a transient thing

# A new satellite data product for studying fire combustion efficiency, fire emission speciation, and fire weather at night and beyond

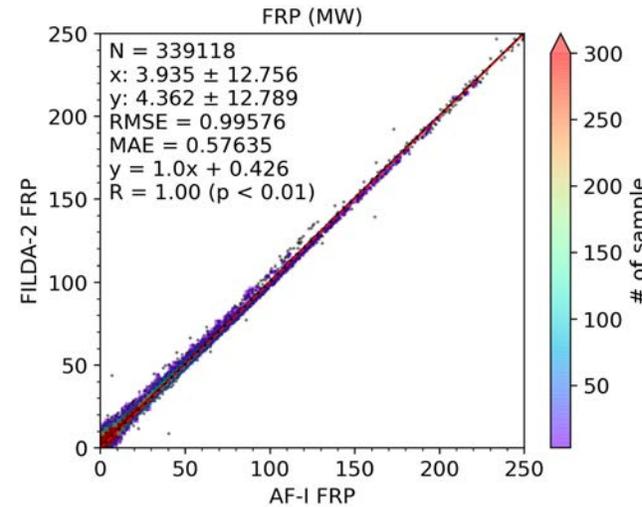

## Validation of FILDA-2

Time: August 2019 ~ August 2020

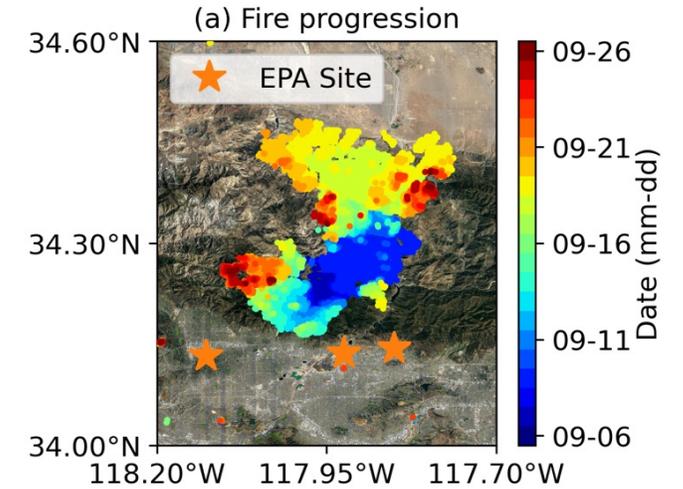

Scale: Global

1. FRP validation against VNP14IMG
2. VJ1 FILDA is validated against VNP FILDA-2
3. FILDA-2 MCE is validated against EPA molar density ratio

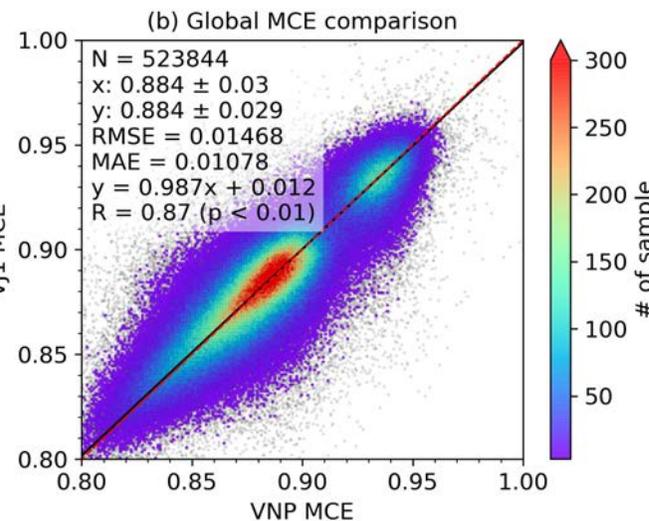

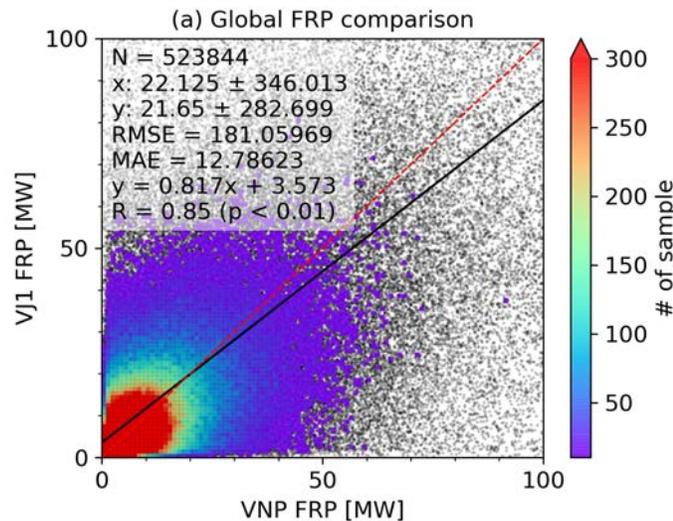

### 1. FRP validation

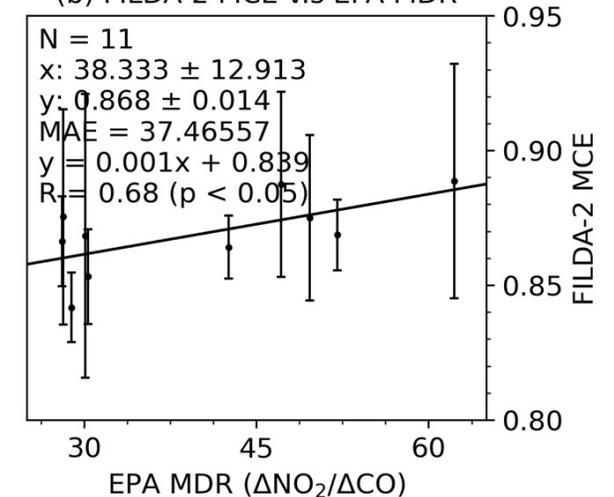

### 3. MCE validation

### 2. VJ1 validation

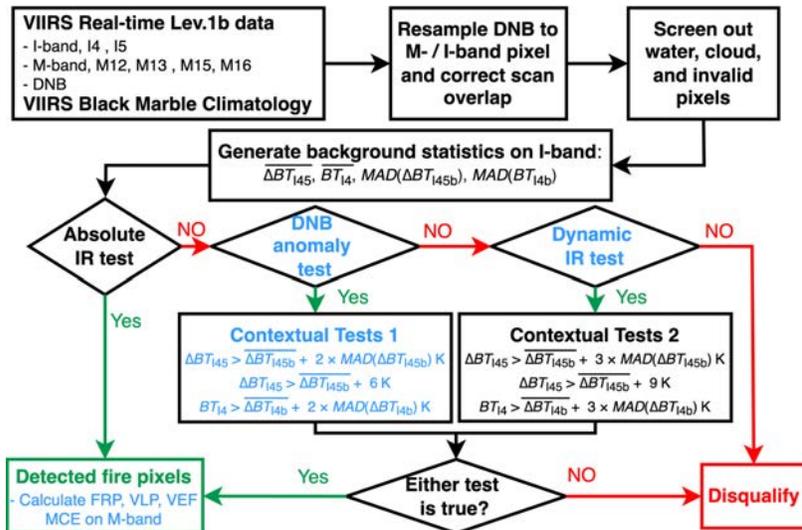

### (b) FILDA-2 MCE v.s EPA MDR

# A new satellite data product for studying fire combustion efficiency, fire emission speciation, and fire weather at night and beyond

## Progress and next steps

## Progress

- Software package are ready and delivered to land team
- ATBD are nearly ready and will be published through ATBD tool
- Benchmark run for Aug. 2019 ~ Aug. 2020
- Validation with multiple products including ASTER, VNP14IMG, EPA trace gas measurements, etc.
- Worked with land team to integrate FILDA-2 to SIPS
  - ✓ Provide rules for FILDA-2 run
  - ✓ Provide rules for static input
- Worked with a few users already to finalize the data content
  - ✓ spectrum radiances of fire pixel as attributes

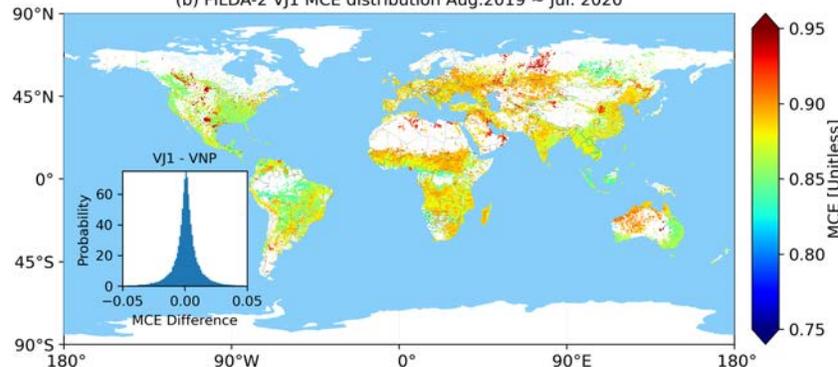

## Challenge & Next Step

- Extension to daytime
- Fire pixel classification
  - waste incineration
  - fracking
  - oil fracking facility
- Assessment & validation
- Adapt to NOAA-21
- Metadata

## Applications...

- Fire lines
- Fire weather

(b) FILDA-2 VJ1 MCE distribution Aug.2019 ~ Jul. 2020

VJ1.MOD.A2019213.0100.001.nc	VJ1.MOD.A2019213.0100.001.nc	Local File
DNB_observations	DNB radiance of fire pixel	1D
